```

Derivatives of Escherichia coli heat labile enterotoxins useful as immunomodulators and for treating diarrhea and which do not bind the glycolipid receptor ${\tt GM-1}$ -

the

The invention relates to peptide fragments of the Escherichia coli heat labile enterotoxin (Etx) and its closely related homologue, cholera toxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are Cc composed of one A subunit and five identical B subunits. The A subunit CC is responsible for toxicity, while the B subunits (EtxB and CtxB) ADP-CC ribosyltransferase activity, while the B subunits (EtxB and CtxB) CC facilitate the entry of subunit A into the host cell via the binding and Ccross-linking of GM-1 receptors. Although GM-1 binding is responsible CC for some of the effects of Etx and Ctx, it has been found that certain CC through GM-1 binding. The peptides of the invention are fragments of the CC beta-4-alpha-2 loop of EtxB and/or CtxB, exerting the same effects as normal EtxB and CtxB subunits, except that they do not bind or cross link CC more may be used in medicine as an immunomodulator or adjuvant. CC They may also be used as an inhibitor for toxin-induced diarrhoea. CC Therefore, the peptides may be used in the production of a composition CC immune disorder and/or toxin-induced diarrhoea. Sequences AX87460-Y87463 Cc correctors the ferred and for toxin-induced diarrhoea. AX87460 being
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match 100.0%;

fragments, toxins, mammalian proteins, structural proteins or receptors. The Bordetella strains are particularly engineered to express the cholera toxin B subunit (this sequence). The promoters used in the constructs are selected from the Bordetella pertussis tox, fha promoters or the high molecular weight (hnw) outer membrane promoter of non typable Haemophilus influenzae; leaders used in the constructs are selected from the cholera toxin B leader (CTB-L), the pertussis toxin subunit SI leader (SI-L) and the pertussin pertactin leader (PN-L); and genes used in the constructs are selected from a novel synthetic cholera toxin B gene (ctb) and the hmw1 and hmw2 genes of Haemophilus influenzae.
                                                                                                                                                                                                                                                                                                                                    Recombinant constructs comprising a promoter functional in Bordetella operatively linked to a heterologous gene or a non-Bordetella leader sequence for secretion of a gene product which may or may not be of Bordetella origin, can be used for the expression in Bordetella of enzymes, antigens, immunogens, allergens, enzyme inhibitors, hormones, lymphokines, immunoglobulins or their
Sequence

The method provides an inexpensive production and delivery system for such antigens to animals. This is the LT-B Escherichia coli toxin subunit and its coding sequence was used in the construction of such a transgenic plant. The immunogenic agent preferably comprises the LT-B or CT-B (cholera toxin B subunit) or optionally LT-A or CT-A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           certain amino acids (aa) were replaced with corresponding aa from heat-labile enterotoxin B subunit (LTB). The specific amino acid substitutions impart LTB-specific epitope characteristics to immunogenic mature CTB. The hybrid molecules have increased cross-reactivity and are suitable for a broad spectrum vaccine to protect against enterotoxigenic illness. Immunogenic proteins comprising the hybrid molecules can be used to treat, or in a vaccine to prevent, enterotoxin-induced illness, e.g. diarrhoea and vomiting, in humans and animals.

Note - This sequence does not appear in the specification, it is a claimed mutant sequence of mature cholera toxin B subunit (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chimeric

                   This is the amino acid sequence of the cholera toxin B subunit used the method of the invention involving the use of nontoxic subunits a an effective adjuvant in coadministration of an antigen to birds and animals. In addition to the use of the toxin as an uncosal adjuvant, it also provides a vaccine comprising the toxin, an immunogenic amount of an antigen, and a pharmaceutically acceptable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAW06007 is a mature cholera toxin B subunit (CTB)/heat labile enterotoxin B subunit (LTB) hybrid molecule. In mature CTB proteir certain amino acids (aa) were replaced with corresponding aa from heat-labile enterotoxin B subunit (LTB). The specific amino acid substitutions impart LTB-specific epitope characteristics to immunogenic mature CTB. The hybrid molecules have increased cross-reactivity and are suitable for a broad spectrum vaccine to protect against enterotoxigenic illness. Immunogenic proteins comprising the hybrid molecules can be used to treat, or in a vaccine to prevent, enterotoxin induced illness, e.g. diarrhoea
          carrier.

                           The invention relates to a recombinant AB5B subunit protein comprising at least one mutation, where the mutation alters the number of amino acid residues available for chemical modification as compared to a wild type AB5B subunit protein, and where the recombinant protein retains an effective target ligand binding affinity. A recombinant AB5B subunit protein such as cholera toxin B protein (CTB) can be specifically covalently linked at lysines or cysteines to an immunogen or vaccine. Recombinant mutant CTB (TCTB) can be used in the treatment of autoimmune diseases e.g. rheumatoid arthritis, encephalomyelitis (or other neuron demyelinating diseases) and diabetes. The TCTB or other B subunits of the invention can also be used to induce tolerance to infection, e.g. parasitic infection. The present sequence represents a CTB variant protein, NCBI GenBank No. GI 1421511.
                                                                                                                                                                                                                                                                                                  Recombinant AB5B subunit protein comprising a mutation that alters the number residues available for chemical modification, useful for covalently linking to an immunogen or vaccine which can be used for

                                                                                                                                                                                                                                                                                                                                          The invention relates to a recombinant AB5B subunit protein comprising at least one mutation, where the mutation alters the number of amino acid residues available for chemical modification as compared to a will type AB5B subunit protein, and where the recombinant protein retains an effective target ligand binding affinity. A recombinant AB5B subunit protein such as cholera toxin B protein (CTB) can be specifically covalently linked at lysines or cysteines to an immunogen or vaccine. Recombinant mutant CTB (CTB) can be used in the treatment of autoimmune diseases e.g. rheumatoid arthritis, encephalomyelitis (or other neuron demyelinating diseases) and diabetes. The rCTB or other B subunits of the invention can also be used to induce tolerance to infection, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AB5B subunit protein; mutation; recombinant; cholera toxin B; CTB; immunogen; autoimmune disease; neuron demyelinating disease; rCTB; infection; parasitic; immunosuppressive; antiarthritic; antirheumatic; antidiabetic; neuroprotective; vaccine; variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Recombinant AB5B subunit protein comprising a mutation that alters the number residues available for chemical modification, useful for covalently linking to an immunogen or vaccine which can be used for treating autoimmune diseases -

                                                                                                                                                                                                                                                                                                                                                                                                                                                             AB5B subunit protein, and where the recombinant protein retains an effective target ligand binding affinity. A recombinant AB5B subunit protein such as cholera toxin B protein (CTB) can be specifically covalently linked at lysines or cysteines to an immunogen or vaccine. Recombinant mutant CTB (rCTB) can be used in the treatment of autoimmune diseases e.g. rheumatoid arthritis, encephalomyelitis (or other neuron demyelinating diseases) and diabetes. The rCTB or other B subunits of the invention can also be used to induce tolerance to infection, e.g. parasitic infection. The present sequence represents a CTB variant protein, NCBI GenBank No. GI 2781121 (Ogawa 41).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant AB5B subunit protein comprising a mutation that alters number residues available for chemical modification, useful for covalently linking to an immunogen or vaccine which can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AB5B subunit protein; mutation; recombinant; cholera toxin B; CTB; immunogen; autoimmune disease; neuron demyelinating disease; rCTB; infection; parasitic; immunosuppressive; antiarthritic; antirheumatic; antidiabetic; neuroprotective; vaccine; variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a recombinant AB5B subunit protein comprising least one mutation, where the mutation alters the number of amino acid residues available for chemical modification as compared to a wild type

                                                                                                                                              E. coli LTB protein variant (GI: 1395122).
                                                                                                                                                                                               AAB62374 standard; Protein;
                                                                                                                                                                                                                                                                                                                             Mature cholera toxin B-subunit is obtained when the signal peptide is cleaved off. There is an Ochre codon at position 343-5; the sequence downstream from it is part of a plasmid.
                                                                                                                                                                                                                                                                                                                                                                                     New hybrid protein, useful in vaccines - contains cholera toxin b subunit and heterologous IgA active

                                                                                                                                                                                     protein such as cholera toxin B protein (CTB) can be specifically covalently linked at lysines or cysteines to an immunogen or vaccine. Recombinant mutant CTB (CTB) can be used in the treatment of autoimmune diseases e.g. rheumatoid arthritis, encephalomyelitis (or other neuron demyelinating diseases) and diabetes. The rCTB or other B subunits of the invention can also be used to induce tolerance to infection, e.g. parasitic infection. The present sequence represents a variant of the E. coli heat labile toxin B (LTB) protein.
                                                                                                                                                                                                                                                                                                                                             The invention relates to a recombinant AB5B subunit protein comprising a least one mutation, where the mutation alters the number of amino acid residues available for chemical modification as compared to a will type AB5B subunit protein, and where the recombinant protein retains an effective target ligand binding affinity. A recombinant AB5B subunit

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           In the patent, the DNA encoding LT-B is expressed as part of a fusion protein with an epitope of a malaria parasite, eg Region I or Region II or a repeat region of circumsporzoite protein antigen (CS) (AAP93560) from Plasmodium berghei. Pref. the fusion gene is inserted into attenuated Salmonella enteriditis under the left promoter control of lambda. Such bacteria can multiply in the host without causing disease disorder and express CS that will induce a protective immune response against malaria and can be used in vaccines. Such vaccines can be
